FAILS TODAY dead — was real in June edgar.apitoll.cloud 0x58bdad5e654691... prior known: yes — our verified set (grade A)	Latest SEC EDGAR filings (10-K/10-Q/8-K) by ticker or CIK.	2 endpoints tested 0 settled on-chain	Every door 402-looped (\$0 settled): NVDA 8-K x2, the exact June AAPL 10-K recipe that worked a month ago, and a third-party storefront (aidress.ai) that settles to the same wallet. LIFECYCLE CHECK: our original 2026-06-15 payment tx 0x86e1449... is on-chain — success, \$0.003 settled to this exact payTo, and it returned Apple's REAL SEC CIK 0000320193 + accession 0000320193-25-000079 (independently verifiable — a dead/fake service cannot produce that). So this was a genuine grade-A delivery in June; it is real payment-rail decay now, not a prior misjudgment. Suspended from our published set. (Re-tested 2026-07-18: payment restored, un-suspended — see the joint note.)
